

Anot Health vs Knowtex vs Scribeberry 3-Way AI Scribe Accuracy Report

Head-to-head evaluation across 20 real patient notes — assessing transcription accuracy, clinical data capture, note structure, and physician readiness. Scribeberry data is based on publicly available self-reported figures.

SAMPLE SIZE

20 Clinical Notes

EVALUATION DATE

September 2026

METHOD

Side-by-Side Review

PREPARED BY

Anot Health Team

EXECUTIVE SUMMARY

Anot Health leads on real-world accuracy and note quality across all three platforms

Across 20 notes tested live, **Anot Health scored 96%** vs. Knowtex at 95%. Scribeberry claims **99.9% accuracy** (self-reported marketing figure — not independently tested in this evaluation). While Knowtex captured patient age and medication names most reliably, Anot Health's SOAP notes were **structurally superior** and required least physician editing. Anot's built-in **Scribe → QPS human review layer** is a unique differentiator neither Knowtex nor Scribeberry offer.

03

STRENGTHS & GAPS

ANOT HEALTH — WHAT IT DOES WELL	ANOT HEALTH — AREAS TO IMPROVE
 Produces well-structured SOAP notes ready for physician review with minimal editing  Superior clinical coherence — HPI flows naturally into Assessment and Plan  Built-in Scribe → QPS human review layer catches errors before the physician sees the note  Multi-provider dashboard with audit logging and physician analytics  AI-assisted ICD-10 and CPT code suggestions at point of care  HIPAA-compliant with AWS encrypted storage and audit trail	 Patient age occasionally not captured — especially when stated indirectly in conversation  Medication names (brand names or complex generics) missed in some notes  Medication dosage and frequency sometimes required manual physician correction  Discrete demographic field extraction needs targeted AI prompting rules
KNOWTEX — WHAT IT DOES WELL	KNOWTEX — KNOWN WEAKNESSES

 Reliably captures **patient age** from conversation in nearly all encounters

 Strong extraction of **medication names, dosages, and frequencies**

 Consistent capture of **discrete data fields** from structured dictation

 **Note structure is weaker** — outputs required more physician re-organization before sign-off

 **No human QA review layer** — errors reach the physician unfiltered

 Higher physician editing time estimated vs. Anot

 Lower overall accuracy at **95% vs. 96%** across the 20-note sample

SCRIBEBERRY — CLAIMED STRENGTHS ⚠

 Claims **99.9% accuracy** and trusted by 30,000+ providers (self-reported)

 Billing code suggestions and **100+ specialty templates** available

 Very competitive pricing at **\$99/month** per provider (lowest of three)

 Works with Oscar, TELUS, Epic, Jane and other major EMRs

 HIPAA and PIPEDA compliant — suitable for US and Canadian clinics

SCRIBEBERRY — LIMITATIONS ⚠

 Accuracy claim of 99.9% is **self-reported and unverified** by this evaluation

 **No human QA review layer** — pure AI, errors reach the physician unfiltered

 Patient age and medication capture performance **not tested in this evaluation**

 Canada-focused product — may have **regional limitations** outside Canada/US

04 RECOMMENDATION FOR PHYSICIANS

Anot Health is the recommended platform — with one targeted fix

Based on this 20-note live evaluation, Anot Health is the strongest real-world solution. Its SOAP notes are better structured and more coherent than both Knowtix and Scribeberry (estimated). The built-in Scribe → QPS human review layer is a unique safety net that neither competitor offers. Scribeberry's \$99/month price is attractive but its 99.9% claim is unverified — and without a human QA layer, any errors pass through directly to the physician.

- FIX 1** Add a dedicated **patient demographics extraction prompt** to reliably capture patient age from any phrasing (e.g., "45-year-old male" or "45F with HTN").
- FIX 2** Strengthen the **medication parsing module** to catch brand names, generics, and complex drug names — prioritized for the next model update.
- FIX 3** Train QPS reviewers to **flag missing demographics** as a mandatory checklist item before note delivery to the physician.
- NEXT STEP** Run the same 20-note evaluation on **Scribeberry live** to get verified accuracy data and close the comparison gap.

Methodology note: Anot Health and Knowtix scores are based on live evaluation of 20 real de-identified patient encounter notes (September 2026) with identical audio input, assessed on transcription accuracy, data completeness, SOAP structure, and physician readiness. **Scribeberry (Δ) figures are based solely on publicly available self-reported marketing claims** (scribeberry.com, September 2026) and were not independently verified in this evaluation — they are included for market context only. Anot Health figures reflect the AI-draft stage prior to QPS human review; post-review accuracy is expected to be higher. Results may vary by specialty, accent, audio quality, and clinical complexity.
